INDEPENDENT RESEARCH / AI-ASSISTED ENGINEERING

# Sterling Tuttle

Learning. Memory. Adaptive systems.

Houston area, Texas | Remote opportunities | Austin considered with a practical on-site arrangement

## RESEARCH DIRECTION

Sterling is working toward a research-lab role focused on learning, memory, adaptive agents and evaluation. His larger interest is how technological progress can support a sustainable society shaped by AI, with present-day problems serving as concrete testing grounds.

## CONTRIBUTION AND WORKING APPROACH

He originates ideas and research directions, guides AI teams through implementation and experiments, questions the results and decides what to investigate next. **AI does most of the coding.** His practical background spans partner relationships, paid search, web development and business operations.

He is also interested in paid AI engineering and consulting that builds useful experience, inspectable work and relationships with experienced technical collaborators.

## PUBLIC WORK TO INSPECT

**TinyHive - agent coordination.** A public project exploring agent communication and coordinated work. A current AI-produced maintenance review documents payload behavior and an original package-test expectation mismatch, with its test conditions and limits stated.

Repository and scoped maintenance report

**Verifiers - evaluation-tooling feedback.** An AI-produced follow-up review on Prime Intellect's project checked a proposed rendering change and suggested a regression test. The public comment credits the original contributor and separates isolated compatibility checks from model-defense effectiveness.

Read the review and its scope

These recent reviews were produced with AI support. They are specific evidence of current participation, not claims of historical personal code authorship, accepted patches or full-system validation.

## START A CONVERSATION

Research opportunities, useful technical collaboration and aligned engineering projects.
